

Introducing "Shared Activity Memory"

New innovative Alexa skill enables Alzheimer's patients to stay up to date with the latest family gossip and to not forget anything anymore despite having a fading memory

MUNICH --Oct. 31, 2019-- Today group 23 of a team of students at MUAS introduced "Shared Activity Memory", a revolutionary Alexa Skill for Alzheimer's patients that allows affected people to easily store and retrieve information about their family members without needing any technical know-how. With this addition, Alexa becomes the ultimate memory aid, so that you, as the patient's family member, will never again have to answer questions for the hundredth time and the patient will no longer have to be ashamed of forgetting the answers. After the necessary information has been stored in the skill, the patient can access it with simple queries such as "Hello Alexa, is Peter still alive?" and bring him-/herself up to date. You as a relative can update the information whenever necessary.

"Wonderful product. Since I got it, I am able to recognize my grandchildren again whenever they come by to visit."

This is just one of the many positive comments and thanks we have received from our testers.
